PROFESSIONAL SUMMARY

Data Analyst with a B.Sc. (Hons) in Mathematics and hands-on experience using SQL, Python, Excel (PivotTables) and Power BI to turn business data into clear, actionable insights. Through independent projects, analyzed 150K+ records across multiple tables, segmented performance by product and discount tier, validated metric accuracy, and built KPI dashboards for technical and non-technical stakeholders. Detail-oriented approach to root-cause analysis, with a focus on reliable data and sound business decisions.

Technical Skills

- **SQL & Data Analysis:** Multi-table joins, CTEs, Window Functions, Subqueries, Data Validation, Data Cleaning, Root Cause Analysis, Statistical Analysis
- **Reporting & Visualization:** Advanced Excel (PivotTables, Power Query), Power BI, DAX, KPI Reporting, Dashboard Development, Data Visualization
- **Programming & Tools:** Python (Pandas, NumPy), Microsoft SQL Server, SSMS, GitHub, VS Code, Google Workspace

PROJECTS

E-Commerce Business Insights | SQL, Power BI

- Analyzed a seven-table Olist marketplace dataset covering 99.4K orders and 96.1K customers and R$16M revenue, wrote 25+ SQL queries to join data, calculate KPIs and prepared business-ready summaries.
- Uncovered a 3.12% repeat customer rate against 97% order fulfillment, flagging retention, not acquisition or delivery, as the primary growth constraint and validated the finding independently via Power BI's AI Key Influencers visual.
- Diagnosed delivery friction by state, finding 8% of orders arrive after the estimated date despite a 12-day average, with performance varying sharply by region (fastest in São Paulo, slowest in remote states).
- Built a 3-page Power BI dashboard with AI-assisted visuals (Key Influencers, Smart Narrative) that reproduced the SQL layer's payment-mix and revenue findings exactly, giving technical and non-technical stakeholders a shared source of truth.

Sales Analytics Dashboard | Python, Power BI

- Cleaned and engineered features across 51K order records with Python and Pandas, validating $12.6M in sales, $1.47M in profit, an 11.6% margin and average shipping time of 3.97 days.
- Identified that Technology drove the highest sales and profit while a small subset of products generated disproportionate losses despite strong sales volume, and quantified that higher discount tiers correlated with declining profitability.
- Built a 3-page interactive Power BI dashboard for executive overview, sales performance, customer & product insights to support KPI monitoring and business review.

Education

B.Sc. (Hons) in Mathematics *2021-2024*
M S Ramaiah University of Applied Sciences

Career Break: National-Level Competitive Exam Preparation
Independent learning: Used this time to built practical skills in SQL, Excel, Python and Power BI through self-directed learning and end-to-end analytics projects.

Working Strengths

- **Data accuracy:** Checks key figures across SQL and dashboard outputs and follows up on inconsistencies.
- **Business focus:** Connects analysis to performance, customer behavior and profitability questions.
- **Ownership:** Independently takes projects from data preparation through analysis and reporting.
